A new study in the journal PLoS ONE by researchers at the University of Utah and the University of Cambridge found people can survive without a phone for up to 24 hours a day without any decrease in daily activities, said the authors. "We are trying to understand how technology affects our lives and whether it changes us and not how we change ourselves," said study researcher Joshua Ackerman, a postdoctoral researcher in psychology at the University of Utah. "So far, we have found that we can survive without a phone for up to 24 hours a day without any substantial negative effects on activities like socialising, eating, sleeping, working, taking care of kids and eating kids' food," Ackerman told CBS News. "In the future, we would like to expand the study to see how we adapt to being phone-free for longer periods." To conduct the study, which was funded by the National Science Foundation, the researchers asked 79 people, all ages 18 to 35, to spend seven days without a phone and then seven days with a phone. In addition to asking participants about their daily activities, they were asked to respond to a battery of psychological and cognitive tests. Get Breaking News Delivered to Your Inbox They found people without a phone had an average of eight to 12 phone calls a day when the phone was off. During the seven days with a phone, they averaged 21 calls a day on average. The results suggest people without a phone were more engaged in personal interactions, the researchers found. Nucleotide-binding oligomerization domain-containing protein 2 (NOD2) regulates immune responses by detecting bacterial peptidoglycan. Nucleotide-binding oligomerization domain-containing protein 2 (NOD2) is an intracellular pattern recognition receptor that recognizes peptidoglycan moieties of bacterial cell walls. NOD2 is expressed on mucosal surfaces, particularly in the gastrointestinal tract, and plays a role in host defense against bacterial infection. We previously showed that the induction of NOD2 by peptidoglycan in an enterobacterial common antigen (ECA)-dependent manner is important for the induction of TNFalpha and IL-6 by peptidoglycan in human mon
